

# KD Chart

## The Most Powerful, Flexible and Complete Charts and Graphs

KD Chart is a tool for creating business charts and is the most powerful Qt component of its kind. Besides having all the standard features, it also enables the developer to design and manage a large number of axes and provides sophisticated means of customization. In addition to detailed and precise configuration of the chart layout, it is possible to complement the design by adding custom rich-text boxes and/or frames to data points or to random positions.

Since it is extremely configurable, KD Chart is also easily scalable by automatically adjusting font sizes and layout when being resized. This makes it possible to quickly and efficiently create user-friendly programs that offer the same level of functionality, or an even higher one, in Qt programs as on other platforms.

### Some of the Newest Features of KD Chart

- Full Interview support – plug any QAbstractTableModel into KD Chart and have the data displayed
- Full Arthur support – make use of the fantastic new rendering possibilities in Qt 4
- Separation of diagrams, coordinates and coordinate planes allows very simple addition of custom chart types and axis scales
- A completely redesigned API that will be a stable basis for years to come
- Enhanced LineDiagram and BarDiagram implementations now have caching techniques where appropriate

### The Complete Set of Charts for Any Qt Application

- Bar
- Line
- Pie
- Ring
- Area
- High/Low
- Box and Whisker
- Polar
